The PrintScreen feature on SBC Linux Systems

There are several ways to capture or print screen images on the SBC Linux systems.

On SBC Linux Workstations use the "Print Screen" key:

"Print Screen" takes a screenshot of the entire screen.

"Alt+Print Screen" takes a screenshot of the window to which the mouse points.

Pressing the "Print Screen" key on the keyboard (near the top right-hand side) presents the "Save Screenshot" dialog. The "Help" button in this dialog describes taking screenshots in greater detail.

Use the Menubar to launch the dialog:

Menubar > Applications > Accessories > Take Screenshot

launches the same "Save Screenshot" dialog as does the "Print Screen" key on the keyboard.

Open the dialog from the command line:

The "gnome-screenshot" is another way to launch the "Save Screenshot" dialog.
